

# Portfolio Website — Design Document

Thejaswini Srinivasan Manjula  
Project 1 - CS 5610 Web Development  
September 2026

## 1. Project Description:

This is my personal portfolio website, built for Project 1 in Web Development. I'm a graduate student at Northeastern University studying computer science, and before this I spent about six years in QA and test automation. This site serves two purposes at once: it meets the assignment requirements, and it's something I can genuinely send to recruiters this year while I look for a Spring 2027 co-op.

The site has four pages. The homepage is intentionally simple with just my name, with a small line above it that rotates between a greeting, a line styled like a bit of code, and a Spanish greeting. The About page tells a short, honest version of my story like what I used to do, and why I'm here now, plus a bit about what I'm actually like outside of work. The Education & Experience page lays out my degrees, my past jobs, and my skills, with each job collapsed to one line until you click to see more. The Contact page has my LinkedIn, GitHub, and email, plus a small word-guessing game, since I like word games and wanted the page to feel like something I actually made rather than a template with my name swapped in.

## 2. User Personas:

### Persona 1: The Recruiter

Scanning through a lot of portfolios in one sitting, with no time to read paragraphs. She just wants to know two things fast: does this person have the right background, and how do I reach them? For her, the homepage and the skills section need to say a lot without asking her to dig for it.

### Persona 2: The Hiring Manager

Doing a closer read after a recruiter has already flagged me. He's more skeptical — he wants real detail, not a list of buzzwords, and he wants to understand how my QA background actually connects to wanting to be a software engineer now. He's the reason the Education & Experience page lets you expand each role for detail, instead of just handing him a bullet list up front.

### Persona 3: The Professor

Grading this as an assignment. He's checking that the site is genuinely mine, that it's well put together and get to know about my skills and my work experience.

### **3. User Stories:**

#### **Story 1: First Impression**

A recruiter finds my resume link and clicks through. She lands on my homepage and, within a few seconds, sees my name and that I'm a CS grad student at Northeastern; nothing else is competing for her attention. If she wants more, the nav bar is right there.

#### **Story 2: Going Deeper**

A hiring manager wants to know if my QA background is actually relevant to a software engineering role, so he opens Education & Experience. Instead of a wall of text for every job, he sees one line summarizing each role, and he only expands the ones he's curious about : like what I actually did at Accenture, or earlier at L&T.

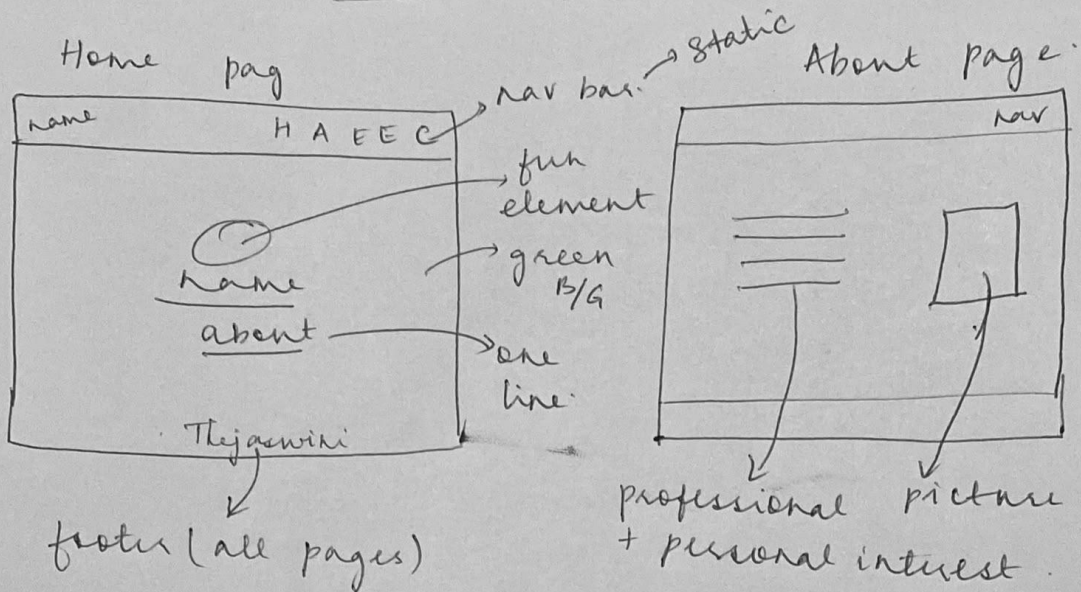

#### **Story 3: Reaching Out**

Someone lands on the Contact page just wanting my email and LinkedIn, but ends up spending an extra minute on the word game before they leave because I'd mentioned liking word games on the About page, and I wanted that to actually be true of the site, not just something I said about myself.

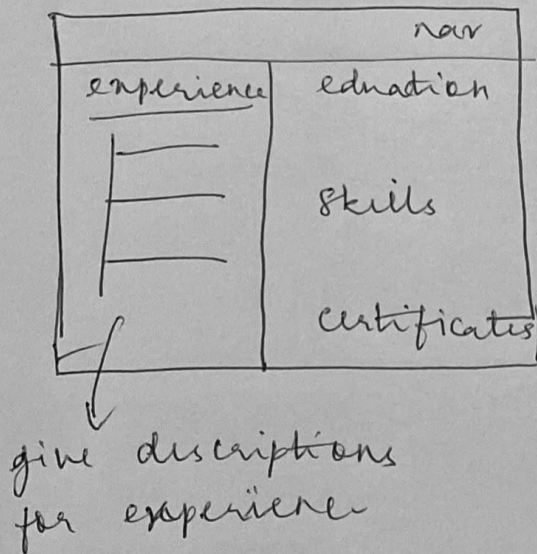

### **4. Design Mock-Ups:**

I sketched each page by hand to work out the layout drawing what goes where, how the navigation connects the pages, and roughly what I am going to place in each section.
